

IX. Binary tree implementation

TREE

Binary $\rightarrow 0$
 $\rightarrow 1$

Root Node

Node

Left Branch

Right Branch

LEFT | NODE | RIGHT

class Node:

def __init__(self, data) \rightarrow None:

self.left = None

self.right = None

self.data = data

Syntax to print left & Right node

def show(self):

print(self.data)

def show(self):

if self.left:

self.left.show()

print(self.data)

if self.right:

self.right.show()

print(self.data)

root = Node(100)

~~root.show()~~

root.left = 99

root.right = 101

root.show()

This is not applicable we need to create the object lets, do it.

root = Node(100)

r = Node(99)

we have created the object.

r = Node(101)

Remind it.

root.left = r.left

root.right = r.right

root.show()
